Errata

On Barari, Coppock, Graham and Padgett (2024), *Public Opinion Quarterly* 88(4)

The maintained replication code behind these errata is at https://github.com/active-maintenance-aec/barari_etal_2024 and is archived at Zenodo at https://doi.org/10.5281/zenodo.24168266, a DOI that always resolves to the latest version.

This note lists seven corrections to "Did Trump's Indictments Rally His Base? Evidence from the Counterfactual Format," published in *Public Opinion Quarterly* 88(4), doi 10.1093/poq/nfae061. It also carries two entries of a second kind, which quote a passage and propose no change to it: a sample size the article states and the deposited data cannot support, and a sentence that calls one appendix table a numerical version of a figure it does not reproduce. **No correction and no note here changes a conclusion of the paper.** The corrections are recorded because a reader who followed the text to a panel, or quoted one of the numbers, would be misled.

Items 1 and 2 are sentences that disagree with the article's own table 2. Item 3 is a caption reporting the wrong group sizes. Item 4 is a figure whose panels are printed in an order the caption and the body text do not describe. Items 5 to 7 are typographic: a colon run into the word after it, and two reference URLs printed with a space where a hyphen belongs, neither of which is an address a reader can follow. Entries 8 and 9 are the notes. Every corrected value below is computed from the deposited replication archive (10.7910/DVN/QDOBJF) at the time this document is rendered. The maintained code is at github.com/active-maintenance-aec/barari_etal_2024.

1. The counterfactual estimates for respondents intending neither primary

Published, p. 1222:

> By contrast, the counterfactual format suggests indifference: these respondents report that the indictment slightly revised their beliefs in favor of the idea that Trump mishandled documents (**+1.8** pp, s.e. = 0.9, **p = 0.05**), with no substantial effect on vote choice (**+0.1** pp, s.e. = 0.9, **p = 0.89**).

Corrected:

> By contrast, the counterfactual format suggests indifference: these respondents report that the indictment slightly revised their beliefs in favor of the idea that Trump mishandled documents (**+1.5** pp, s.e. = 0.9, **p = 0.124**), with no substantial effect on vote choice (**+0.3** pp, s.e. = 0.9, **p = 0.752**).

Table 2 already prints all four corrected values. The two standard errors quoted in the sentence are right, so the estimates were not computed on a different sample; the four wrong figures appear only here.

2. The p-value for the effect on Republican primary vote

Published, p. 1222:

> Republican primary voters also thought that the indictment made them less likely to vote for Trump in the primary: on average, they reported a 64.1 percent chance of doing so, compared with 65.7 percent if the indictment had not been issued (difference = 1.6 pp, s.e. = 0.6, **p = 0.02**).

Corrected:

> Republican primary voters also thought that the indictment made them less likely to vote for Trump in the primary: on average, they reported a 64.1 percent chance of doing so, compared with 65.7 percent if the indictment had not been issued (difference = 1.6 pp, s.e. = 0.6, **p = 0.007**).

Table 2 prints 0.007 for the same estimate. The estimate and its standard error are stated correctly, and the finding is significant at conventional levels on either figure.

3. Figure 1's caption reports the wrong group sizes

Published, p. 1224, Figure 1 caption:

> Figure 1a displays results for respondents who did not plan to vote in either primary (N = **754**). Figure 1b and 1c displays results for those who plan to vote in the Republican primary (N = **2,026**) and Democratic primary (N = **1,953**).

Corrected:

> Figure 1a displays results for respondents who did not plan to vote in either primary (N = **889**). Figure 1b and 1c displays results for those who plan to vote in the Republican primary (N = **2,028**) and Democratic primary (N = **1,921**).

The three published figures are the counts of respondents by partisan identity, not by intended primary: 754 respondents identify as Independents, 2,026 as Republicans and 1,953 as Democrats. They are the group sizes of figure A.1.

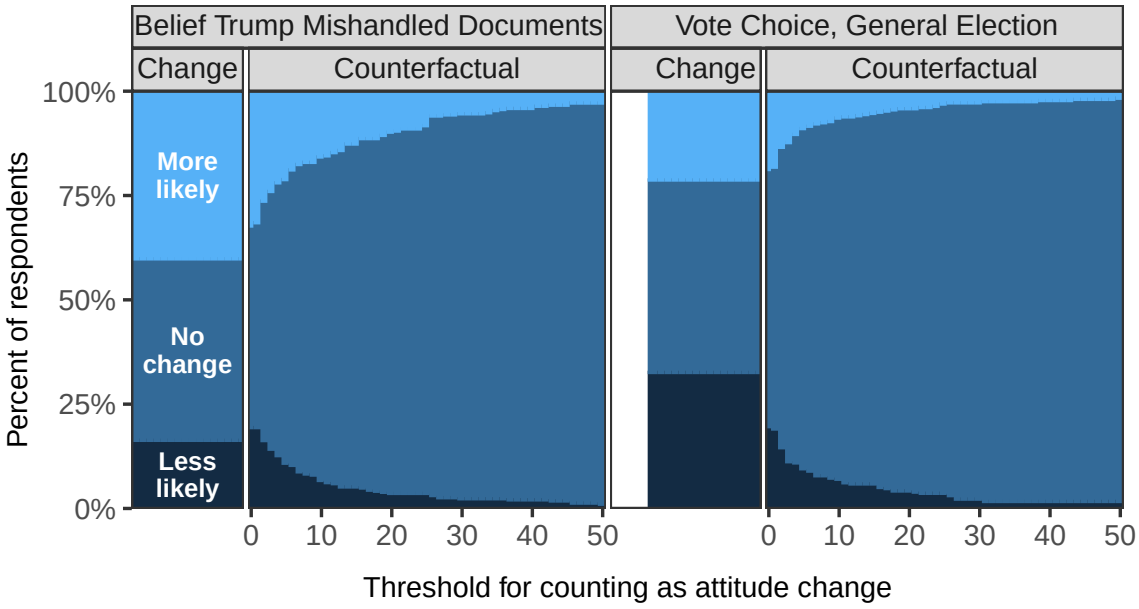

4. Figure 1's panels are printed in the wrong order

Published, p. 1224, Figure 1 caption:

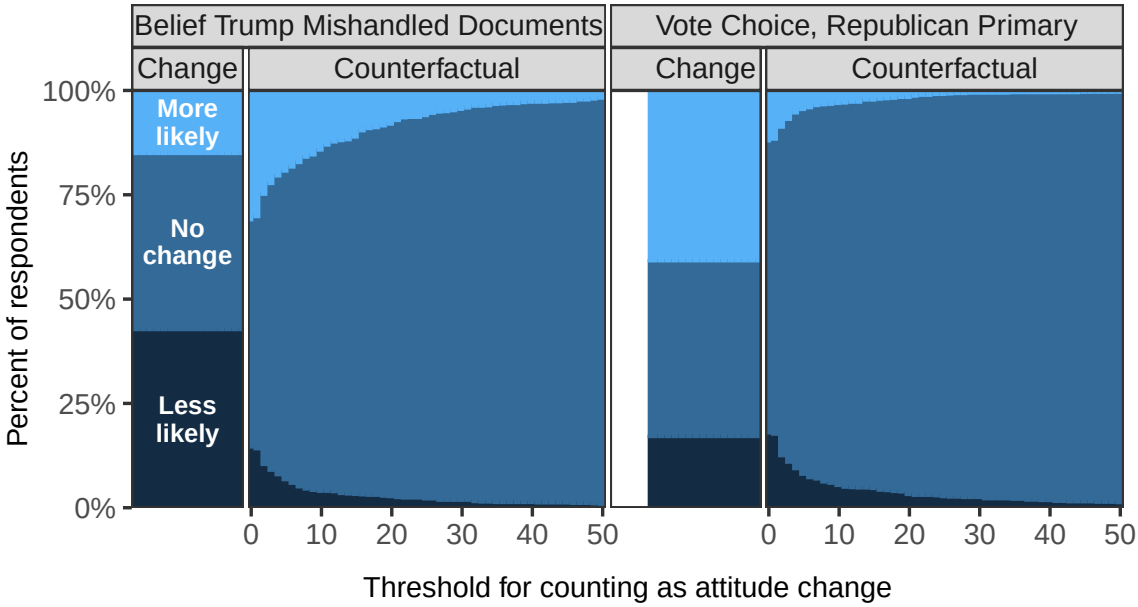

> Figure 1a displays results for respondents who did not plan to vote in either primary (N = 754). **Figure 1b** and **1c** displays results for those who plan to vote in the Republican primary (N = 2,026) and Democratic primary (N = 1,953).

The panel printed as **(b)** is the Democratic one. Its belief column shows 79.5 per cent of respondents saying more likely against 4.9 per cent saying less likely, and its vote column is the general election, which only respondents outside the Republican primary were asked about. The panel printed as **(c)** is the Republican one, with a belief split of 15.1 per cent more likely against 42.7 per cent less likely and a Republican primary vote column. The body text carries the same assignment as the caption and so points at the wrong panel twice, at "In figure 1b, huge fractions of Republican primary voters report that the indictment made them think it was 'less likely' Trump mishandled documents" and at "We see this same basic pattern (reversed) among Democratic primary voters in figure 1c."

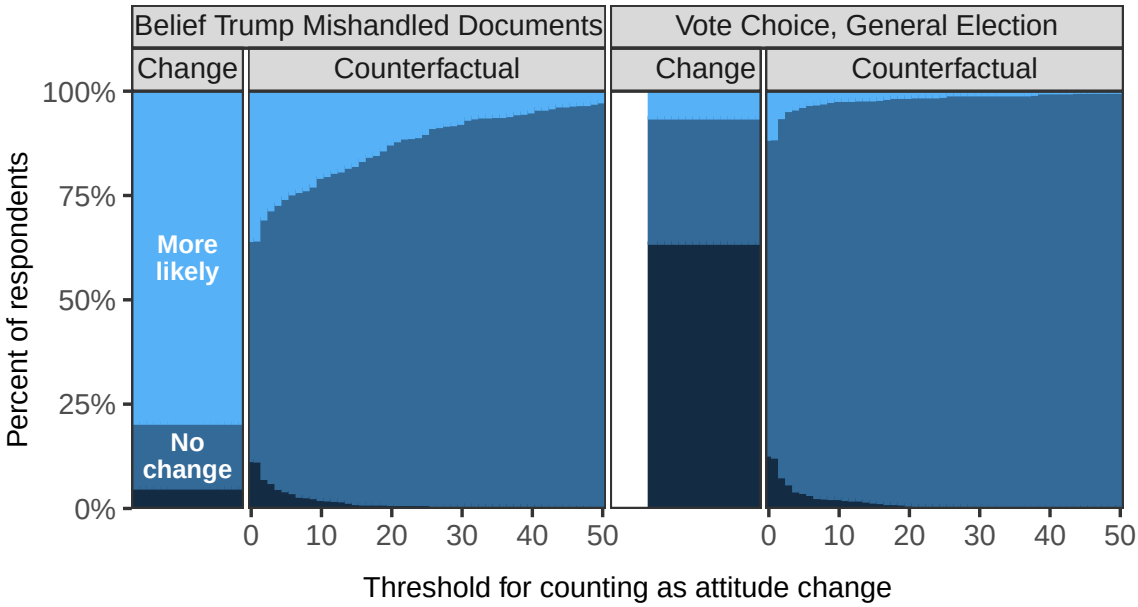

Corrected: figure 1 is reprinted below with its panels in the order the caption and the body text describe. Nothing plotted differs.

(a) Respondents who did not plan to vote in either primary

(b) Respondents who plan to vote in the Republican primary

(c) Respondents who plan to vote in the Democratic primary

Note: Figure 1 as published, with the panels reordered to match the caption and the body text. Every plotted proportion is unchanged. Drawn from the deposited replication archive by `maintained/figure_1_thresholds_by_primary.R`, whose file names carry the letters the article printed.

5. A missing space after a colon

Published, p. 1217:

> the approach ameliorates the response substitution **problem:rather** than having

Corrected:

> the approach ameliorates the response substitution **problem: rather** than having

The colon runs into the word after it. This could not be settled from the published text layer, which returns the same string whether the page sets a space the extractor drops or sets none: the RENDERED page prints no space, so it is what the page sets.

6. The CBS News URL prints a space where a hyphen belongs

Published, p. 1232:

> see-security-risk-after-**trump indictment/**

Corrected:

> see-security-risk-after-**trump-indictment/**

A space is not a character a URL can carry, so the address as printed is not an address. Both halves are on one line of the published page, so the space is the page's own and not a line break the extractor left behind. With the hyphen restored the address resolves. Entry 7 is the same defect in the FiveThirtyEight entry on the page after.

7. The FiveThirtyEight (2023b) URL prints a space where a hyphen belongs

Published, p. 1233:

> say-after-trumps-**second indictment/**

Corrected:

> say-after-trumps-**second-indictment/**

The same defect as entry 6, one page later and in the second of the article's two FiveThirtyEight references. Both halves are on one line of the published page, and with the hyphen restored the address resolves.

Carried, and not corrected

The two entries below are different in kind from the seven corrections above. Each quotes a passage this edition reprints exactly as the paper published it, and proposes no change to it.

The first is a count the article states and the deposit does not contain: the archive cannot show that 5,011 is wrong, only that it holds fewer respondents, so there is no token to set in its place. The second is a sentence whose repair would be a new sentence about how Table A.2 and Figure 1 relate, which is the authors' to write.

Each is recorded here because an edition that silently reproduced them would leave a reader unable to tell a faithful reprint from an uncorrected error.

8. The article reports 5,011 completed surveys and the deposited data hold fewer respondents

Published, p. 1219:

> We surveyed 5,011 Americans between June 22 and 27, 2023, using SurveyMonkey's "river sample," wherein a random sample of the platform's over two million daily respondents to customer-generated surveys are invited to take an additional, voluntary survey.
>
> Of the 6,877 respondents that began the survey, **5,011** completed it (73 percent).

The deposited file, data.csv, holds 4,838 rows, with ids running from 1 to 4,838 and no gaps, and neither the deposit's README.txt nor its codebook mentions an exclusion, so 173 of the respondents the article counts are not in it. Tables 2, A.2, and A.3 reproduce cell for cell from the 4,838 rows, and the three group sizes in Figure 1's caption (see entry 3) are the deposit's own party identification counts exactly, so the analysis sample is the deposited one. The shortfall shows only in Table A.1, a profile of the sample and not an estimate from it: 35 of its 38 cells differ from the published figure, by 0.3 of a point at the median and by no more than 1.4. The weighted Biden approval the article quotes at 40.4 percent comes out at 41.4 percent on the deposited rows. Nothing here establishes that 5,011 is the wrong figure: respondents who began and did not finish are not in any respondent file, so the 173 are absent from the file without that being evidence about the survey. The article's sentence is therefore reprinted as published, and what a reader needs to know is that the deposit cannot rebuild the sample the article describes. No conclusion of the paper changes: Tables 2, A.2, and A.3 reproduce from the deposit as printed, and the article's estimates rest on them.

9. Appendix B calls Table A.2 a numerical version of Figure 1 and the two differ

Published, p. 1228:

> **Table A2 is a numerical version of figure 1.**

Figure 1 plots unweighted shares of respondents, and Table A.2 reports weighted percentages, so the table's change-format rows do not reproduce the figure's plotted shares. The largest of the 18 disagreements is 3.6 points, in the beliefs block's positive-effect row for the Democratic column: the figure plots 79.5 per cent and the table prints 76.0. Neither number is wrong, since each is the right value for its own weighting, and the repair would be a different sentence about how the two are related, which is the authors' to write. The sentence is reprinted as published. No conclusion of the paper changes: the table is a separate presentation of the same responses, and the text quotes its numbers, not the figure's.
